AMERIGEL® WOUND CARE INSTRUCTIONS

Revised 6/2004

WOUND CLEANSING

AmeriGel® Wound Dressing is classified by the FDA as a hydrogel wound filler indicated for the following uses: stage I-IV pressure ulcers, diabetic skin ulcers, venous stasis ulcers, 1st & 2nd degree burns, post-surgical incisions, cuts and abrasions.

We recommend cleansing the wound with Amerigel® Wound Wash solution or a saline irrigation solution (*Do Not Use Contact Lens Solutions*). Pour the saline over the wound and rinse thoroughly. To avoid disturbing the wound bed, do not scrub the wound aggressively. Gently blot dry the excess saline with a clean gauze or cloth before re-applying AmeriGel®.

APPLYING AMERIGEL® WOUND DRESSING

Following wound cleansing, apply a thin coat of AmeriGel® to the wound and the surrounding skin, extending approximately 1/2 inch beyond the wound.

Dressing the Wound

Moisten a gauze pad (2x2, 4x4, etc.) with saline. The gauze should be similar in dampness to a washcloth that you would wash your face with, not dripping wet, but not wrung dry. Following the application of AmeriGel®, place the dampened gauze over the wound. Next, place a dry piece of gauze on top of the damp one. This will provide a moist environment for the wound and additional gauze to absorb any drainage. Secure the gauze pads in place with tape or roll gauze.

WOUND CARE TIPS

- 1. Change the dressing twice a day for the first week and once a day thereafter.
- 2. If the gauze sticks to the wound, soak it with saline until it falls off without pulling on the wound.
- 3. Do not use peroxide, povidine-iodine or alcohol on a chronic wound that has existed for more than 90 days.

FOR ANY PROBLEMS OR QUESTIONS, PLEASE CONTACT YOUR PHYSICIAN.

Attention:

Please place business card here <u>before</u> making copies.

- 4. Some patients report a "stinging" or "burning" sensation, similar to that of hydrogen peroxide, when they initially apply AmeriGel®. This is the antimicrobial action working on the wound.
- 5. Increased drainage may occur and the wound may appear to get deeper with the first few applications. This is a good sign as long as they both happen together. Wounds generally heal from the inside out, becoming shallower, allowing the surrounding skin to close over the wound.
